Observation - Week 01

Topic: HTML5 and CSS3

Name: _____ Roll No: _____ Date: _____

Aim

To design a responsive web page using semantic HTML5 elements, form controls, and CSS3 Flexbox layout.

Concepts Covered

- Semantic elements: header, nav, main, section, article, footer
- Form controls and built-in validation (required, type=email)
- CSS variables, Flexbox (justify-content, align-items, flex-wrap)
- Media queries for responsive design

Observations

- Semantic tags improve accessibility and SEO compared with generic div elements.
- flex-wrap lets cards reflow onto multiple lines when the viewport narrows.
- The browser blocks form submission when a required field is empty or the email format is wrong.
- Media queries change the layout at the 600px breakpoint without any JavaScript.

Viva Questions

1. What is the difference between block and inline elements?
2. Flexbox vs Grid - when to use which?
3. What does box-sizing: border-box do?
4. What is the viewport meta tag used for?
