Observation - Week 02

Topic: JavaScript ES6 and DOM

Name: _____ Roll No: _____ Date: _____

Aim

To manipulate the DOM using ES6 features and to fetch remote data asynchronously.

Concepts Covered

- let/const, arrow functions, template literals, destructuring
- DOM selection, creation, and removal of elements
- Event listeners and event bubbling
- Promises, async/await, and the fetch API

Observations

- Arrow functions do not have their own this binding.
- stopPropagation prevents the delete button click from also toggling the task.
- fetch only rejects on network failure, so response.ok must be checked manually.
- async/await with try/catch is easier to read than long .then() chains.

Viva Questions

1 Difference between var, let and const?

2 What is event bubbling?

3 What is a Promise and its states?

4 What is the difference between == and ===?
